

AI PRODUCT MANAGEMENT · CASE STUDY

FROM PATIENT INSIGHT TO PRODUCT BLUEPRINT

MyCCAngel

How an IBD patient's idea became a structured healthcare platform—and how I led the product work behind it.

Community

01 • THE ORIGIN

It started with lived experience—not a product brief

My co-founder lives with IBD.

He originated the idea for a platform that could make daily life with Crohn's and Colitis less isolating.

Together, we refined what the platform should become. I translated that lived experience into a product direction, user journeys, requirements, AI concepts, and a coordinated development plan.

02 • MY ROLE

I connected patient need, product strategy, AI, and delivery

03 • FRAME THE PROBLEM

Life between appointments was the real product space

IBD care happens in appointments. IBD life happens every day.

The opportunity was not another symptom tracker. It was trusted support across the moments patients navigate alone.

**Fragmented information**

Advice spread across forums, PDFs, and search

**Isolation**

A stigmatized condition that is difficult to discuss

**Unanswered questions**

Support gaps between clinical appointments

**Daily uncertainty**

Practical anxiety, including toilet access

04 • DISCOVER

We moved from assumptions to a needs map

RESEARCH APPROACH

- 1 Patient conversations
- 2 Clinician and IBD-nurse input
- 3 Community and forum analysis
- 4 Competitive product review

SYNTHESIS

Emotional

Belonging and reassurance

Informational

Trusted, relevant answers

Practical

Help in real-world moments

Design implication: earn trust first, then personalize support around each patient's context.

05 · PRODUCT DECISIONS

Five decisions turned the idea into a focused product

01

Verify reports

BECAUSE

Trust

02

**Recommend from
intake**

BECAUSE

Solve cold start

03

**Prioritize toilet
locator**

BECAUSE

Immediate user value

04

Defer doctor directory

BECAUSE

Partnership dependency

05

**Sequence chatbot
later**

BECAUSE

Trusted content first

06 • PRIORITIZE

The roadmap sequenced trust before expansion

PHASE 1 • FOUNDATION

Prove a trusted, personalized core

01 Registration

02 Medical verification

03 Profiles

04 Adaptive survey

05 Recommendations

06 Messaging

07 AI chatbot

08 Toilet locator

PHASE 2 • ECOSYSTEM

Expand after partnerships and usage signals

Doctors

Dietitians

Groups

Events

Restaurant finder

Why: the first release had to establish trust, useful profiles, and recommendation inputs before broadening the network.

07 • DESIGN THE EXPERIENCE

Onboarding became the bridge from trust to personalization

I designed onboarding as a progressive exchange: explain why data matters, ask one clear question at a time, and use every answer to improve relevance.

Design principles

- One question per screen
- Plain, empathetic language
- Only relevant follow-ups
- Visible progress and control

08 • DESIGN THE LOGIC

A branching survey asked less—and learned more

09 • BUILD TRUST WITH AI

Medical verification had to handle messy real-world documents

**THE CHALLENGE**

Different hospitals, layouts, scans, photos, and OCR errors.

MY PRODUCT RESPONSE

Define a resilient preprocessing pipeline before classification—and treat uncertain outputs as a trust risk, not just a model error.

10 • SOLVE THE COLD START

Recommendations worked before interaction data existed

PRODUCT CHALLENGE

No users.
No interactions.
No history.

The intake survey created useful first-party signals from day one, giving new users a relevant starting point while the system learned over time.

11 · CONNECT THE PRODUCT

The MVP linked four kinds of support in one experience

12 · PRODUCT EVIDENCE

The concept became a connected end-to-end experience

13 · WORK WITH ENGINEERING

I made the work buildable, testable, and visible

14 • BEHIND THE SCENES

Product leadership was the connective tissue

My job was not to own every craft.

It was to keep user need, business choices, design, data, AI, and engineering moving toward the same outcome.

01

Research

02

Requirements

03

Onboarding

04

Data schema

05

AI planning

06

UX collaboration

07

Developer coordination

08

Testing

09

Prioritization

15 · LEARN

Pausing the build was also a product decision

01

What we proved

A coherent product concept, onboarding logic, AI workflows, recommendation strategy, and working product designs.

02

What remained

Clinical governance, broader validation, reliable content partnerships, and the operating model required for safe scale.

03

What I learned

In healthcare, product ambition must be matched by trust infrastructure, evidence, and sustainable delivery capacity.

16 · REFLECTION

Building MyCCAngel taught me...

Successful AI products are not built by starting with AI—they are built by deeply understanding users, earning trust, and solving meaningful problems one decision at a time.
